CS6107 – COMPUTER ARCHITECTURE

Module – 7
INSTRUCTION LEVEL PARALLELISM

Presented By
Dr. S. Muthurajkumar,
Assistant Professor,
Dept. of CT, MIT Campus,
Anna University, Chennai.

MODULE - 7

- Instruction Level Parallelism
- Pipelining
- Overview of pipelining
- Performance
- Pipeline Hazards
- Pipelined datapath and control
- Handling data hazards and control hazards
- Exceptions
- Introduction to advanced ILP

INSTRUCTION LEVEL PARALLELISM

- Simple pipeline checked structural, data hazards in Instruction Decode (Instruction Issue)
- Instead, split ID stage in two:
  - Issue—Decode instructions, check for structural hazards
  - Read operands—Wait until no data hazards, then read operands

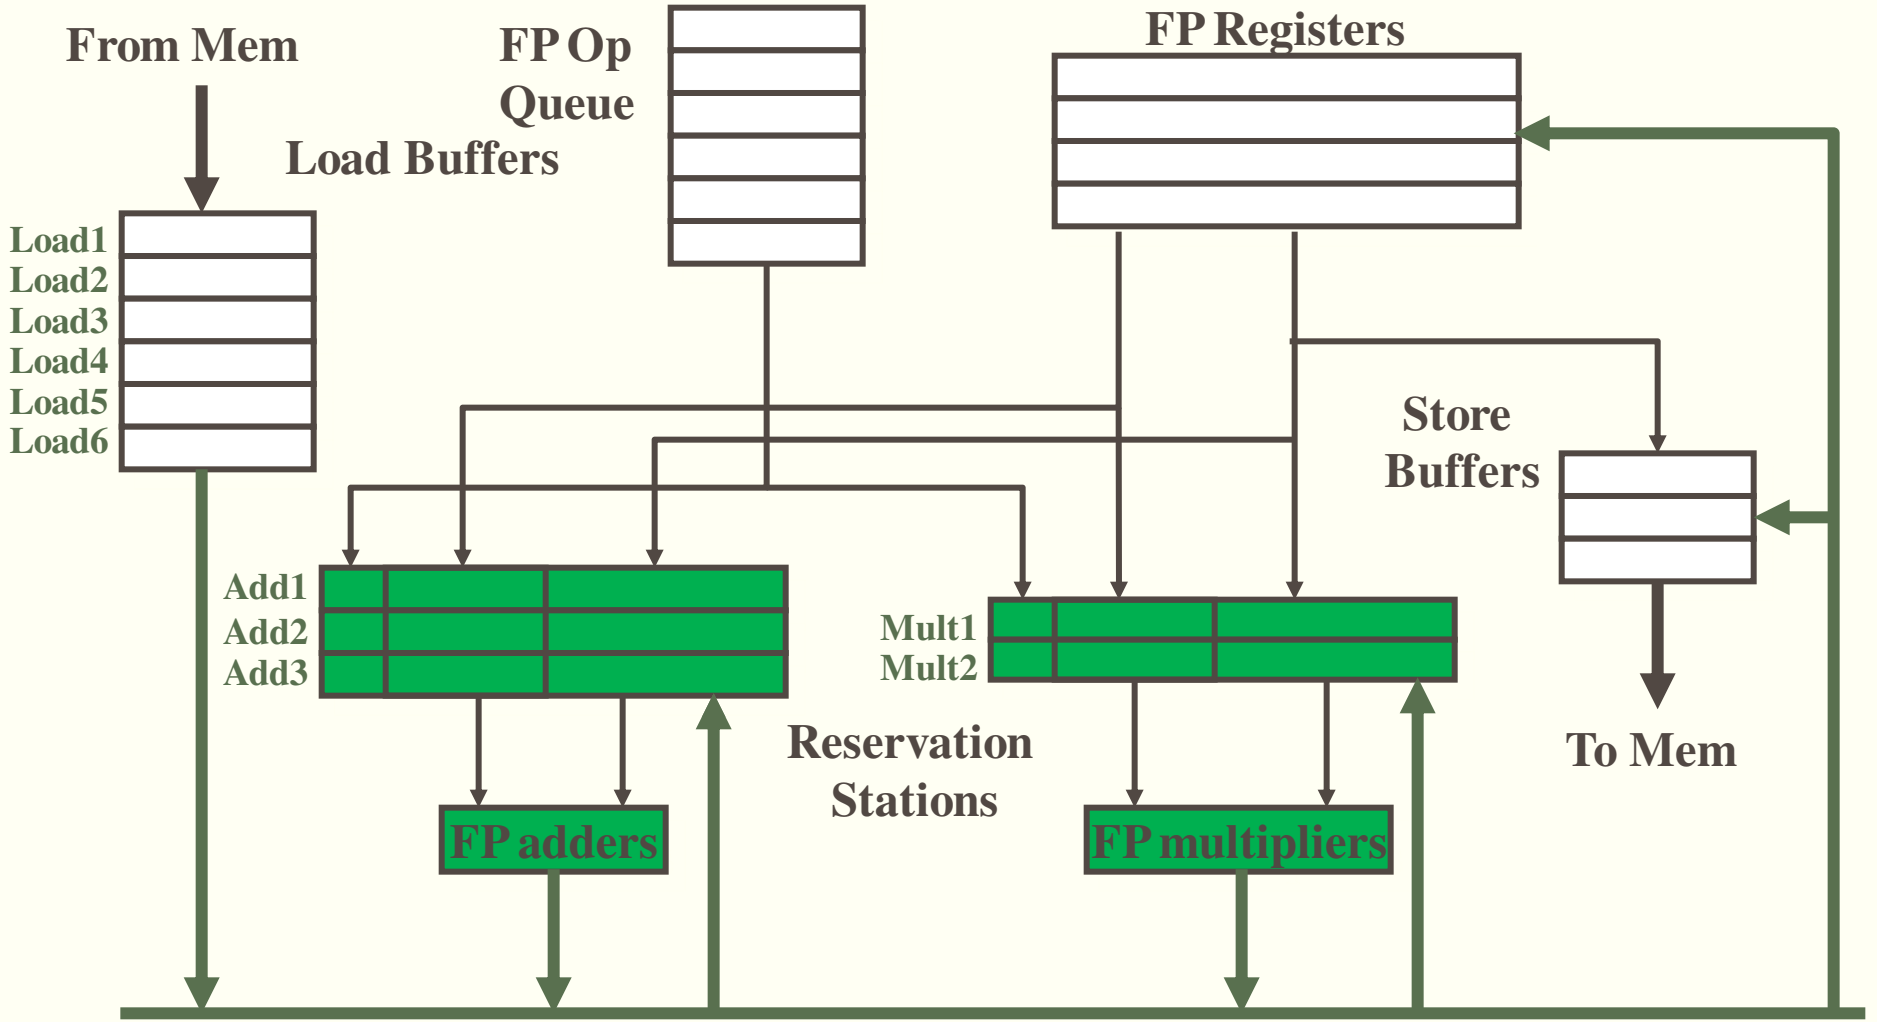
TOMASULO

- Avoids WAR, WAW hazards
- Allows loop unrolling in Hard Ware
- Not limited to basic blocks
- Lasting Contributions
  - Dynamic scheduling
  - Register renaming
- 360/91 descendants are PowerPC 604, 620; MIPS R10000; HP-PA 8000; Intel Pentium Pro

TOMASULO ALGORITHM (DATA FLOW)

- Data fed to FU from RS, not through registers
- All data travels over Common Data Bus
  - Broadcasts results to all waiting FUs
  - Also back to registers
  - Avoids RAW hazards by executing an instruction only when its operands are available
- Load and Stores treated as FUs
  - Have own RSs

TOMASULO ORGANIZATION



REGISTER RESULT STATUS

Op: Operation to perform in the unit (e.g., + or –)

Vj, Vk: Value of Source operands

Store buffer has V field, result to be stored

Qj, Qk: Reservation stations producing source registers (value to be written)

Note: Qj,Qk=0 ⇒ ready

Store buffers only have Qi for RS producing result

Busy: Indicates reservation station or FU is busy

RESERVATION STATION COMPONENTS

- One entry for each register
- Indicates which functional unit will write
- Blank if no pending instructions will write
- If WAW, lists last to write

THE COMMON DATA BUS

- Normal bus is “Go To”
  - Put data on bus
  - Specify destination
- CDB is “Come From”
  - Put data on bus (64 bits)
  - Specify who is producing it (4 bits, on 360/91)
  - Destination says “I’m waiting for that” and grabs
  - Broadcast: multiple destinations can receive data
  - Destinations can also ignore

Three Stages of Tomasulo's Algorithm

1. Issue—get instruction from FP Op Queue
   - If reservation station free (no structural hazard), control issues instructions & sends operands
   - Picking RS has effect of renaming registers
2. Execute—operate on operands (EX)
   - Watch Common Data Bus to pick up operands from prior instructions
   - When both operands ready, can execute
3. Write result—finish execution (WB)
   - Write to all waiting units via Common Data Bus
   - Mark reservation station available

LATENCIES FOR TOMASULO EXAMPLE

- Floating add: 3 clocks
- Multiply: 10 clocks
- Divide: 40 clocks

Tomasulo Example

Instruction stream

Instruction status:

Instruction		j	k	*Issue*	*Exec Comp*	*Write Result*

	Add3	No					
	Mult1	No					
	Mult2	Yes	DIVD	M*F4	M(A1)		

Register result status:

Clock		F0	F2	F4	F6	F8	F10	F12	...	F30
56	FU	M*F4	M(A2)		(M-M+M	(M-M)	Result			

- **Once again: In-order issue, out-of-order execution, and out-of-order completion.**

WHY CAN TOMASULO OVERLAP LOOP ITERATIONS?

- Register renaming
  - Multiple iterations use different physical destinations for registers (dynamic loop unrolling).
- Reservation stations
  - Permit instruction issue to advance past integer control-flow operations
  - Also buffer old values of registers
    - Totally avoids WAR stalls
- Another perspective:
  - Tomasulo builds data flow dependency graph on the fly

TWO MAJOR ADVANTAGES OF TOMASULO'S SCHEME

- Distributed hazard-detection logic
  - Distributed reservation stations
  - CDB
  - If multiple instructions waiting on single result, all simultaneously released by CDB broadcast
  - With centralized register file used instead,
    - Units have to read results from registers
    - Means waiting for register bus availability
- Eliminates stalls for WAW and WAR hazards

TOMASULO DRAWBACKS

- Complexity
  - Delays of 360/91, MIPS 10000, Alpha 21264, IBM PPC 620 in CA:AQA 2/e
    - But not in silicon!
- Many associative stores (CDB) at high speed
- Performance limited by Common Data Bus
  - Each CDB must go to multiple functional units
    $\Rightarrow$ High capacitance, high wiring density
  - Only one functional unit can complete per cycle
    - Multiple CDBs $\Rightarrow$ more FU logic for parallel assoc stores
- Non-precise interrupts!
  - We will address this later
